

**Digital Library Curriculum Development**  
**Module: 6-d: Interaction Design & Usability Assessment**

(Draft, Last Updated: 2008/06/05)

**1. Module name:** Interaction Design & Usability Assessment

**2. Scope**

This module covers the basic concepts and processes related to interaction design for digital libraries. Methods of user analysis, tasks analysis, prototype development, and usability testing will be discussed.

**3. Learning objectives:**

Students will be able to:

1. Explain the basic concepts and processes related to designing interfaces for digital libraries.
2. Develop user persona and benchmark tasks for usability testing of DL interfaces.
3. Conduct a heuristic evaluation of usability of a digital library

**4. 5S characteristics of the module**

- Society: DL interfaces are designed based on the needs of the user community of digital libraries.
- Scenarios: Scenarios related to user activities in digital libraries can be reformatted as user tasks and used for testing the usability of the digital libraries.
- Spaces: DL systems and their users interact with one another through the user interface, which is a space between the system and users.
- Structures: usability evaluation methods have structures. For example, the cognitive walk-through is structured in a way that the analysts ask questions step-by-step to examine the DL system. Good structure in designing the user interface might ensure the increased usability of the system.
- Stream: N/A

**5. Level of effort required:**

- a. Class time: 3 hours
- b. Course preparation for students: 2 hours / session
  - Mostly associated with readings (See the reading list for students in 11. Resources, below)
- c. Course assignment completion:
  - Heuristic Evaluation: 3 hours

## 6. Relationships with other modules

### a. 5-b: Application Software

5-b covers various features and technologies of DL application software, and these application software packages provide various templates of the interfaces easily applicable to build digital libraries as well as the architectural infrastructure to manage the sources.

### b. 6-a: Information Needs, 6-b: Information Seeking Behaviors

In order to design effective information systems for digital libraries, it is important to learn how users understand systems and perform tasks before developing the user interfaces. Thus, the user characteristics and cognition involved with using digital libraries will be covered by 6-a, and 6-b. It is recommended to teach 6-a and 6-b prior to the current module, 6-d: Interaction Design module.

### c. 6-e: Information Visualization

6-e discusses advanced features and technologies of interface design mostly relevant to emphasizing on the visual impact and use of DL sources, while the current module, 6-d, covers the basic process and skills relevant to design and evaluate interfaces.

### d. 9-c: DL evaluation, user studies

9-c covers methods for evaluating the overall aspect of a digital library, such as its outcomes, impacts and benefits. The current module 6-d could be the subset of the user studies discussed in 9-c, focusing on the user information interaction.

## 7. Prerequisite knowledge required:

- No prerequisite courses are required.
- No technical programming or any other skills are necessary.

## 8. Introductory remedial instruction: None

## 9. Body of knowledge

### Session 1: Interaction Design & Usability Test

#### 1. Interaction Design in Digital Libraries

- Visualizing what appears on the screen of a digital library
- Identifying how users manipulate, search, browse and use objects in a digital library
- Enhancing the effective interaction among components of digital libraries
- Interacting design elements of digital libraries

 Figure 1: The Cascade of Interactions in the Digital Library Interface

(Bates, 2002)

## 2. The Process of Interaction Design

Lifecycle of Interface Design

### Key Principles for User-Centered System Design

(Available at: <http://www.it.uu.se/research/hci/acsd/KeyPrinciplesPoster-v.1.2en.pdf>)

- Analyze requirements and user needs
- Design for usability by prototyping
- Evaluate use in context
- Feedback plan the next iteration

## 3. Identifying users' needs and establishing corresponding requirements

- User Analysis
  - Scope/definition of user group
  - User characteristics
    - Demographic information  
e.g., age, sex, perceptual abilities and handicaps, motor skills and physical disabilities, etc.
    - Knowledge and experience  
e.g., level of education, reading level, native language, knowledge of particular (domain-specific) terminology, etc.
    - Computer/IT experience or knowledge  
e.g., computer literacy (naive, novice, skilled, expert), level of experience with similar systems, level of experience with other systems
    - Level of experience with the task
    - Psychological characteristics  
e.g., attitudes, motivation to use the system
- Developing user personas
  - Understanding information needs and information seeking behaviors of users  
(See, module 6-a and 6-b for detailed information)
  - Building personas
    - Interviews with real users

 Pointers for Developing Useful Persona (p.17) (Head, 2003)

- Categorizing user types
  - e.g., Primary, Secondary, and Others
- Annotating user characteristics according to the categories
- o Specifying User Tasks
  - Understanding typical DL tasks
    - The frequency or timing of the task
    - The complexity and difficulty of the task
    - The relationship of the task to other user tasks
    - The physical environment of task performance
    - The social, organizational and cultural environment of the task
  - Challenges in developing effective tasks for usability test of digital libraries (Notess, Kouper, and Swan, 2005)
    - It is necessary to develop and refine tasks iteratively through testing different versions.
    - Real user needs are complex, so it is hard to create representative tasks focusing on testing a particular feature.
    - Unrealistic user tasks can make users hesitant and reluctant to carry them out.

#### **4. Designing an interface**

- o Applying the empirical evidence obtained from user analysis to the design
- o Making design decisions in every step of the process (Hutchins, Hollan, & Norman, 1986)
  - Planning phase
    - Designing interfaces in order to achieve user goals
  - Translation phase
    - Transforming user behavioral intentions to specific actions
  - Physical actions
    - Representing the planned sequence of actions to interfaces
  - Assessment

- Evaluating whether users sense and interpret the interfaces as they are meant to be.
- Evaluating whether the outcomes achieve the user goal
- Constructing a prototype of the interface
  - Prototype: “A limited representation of a design that allows users to interact with it and to explore suitability” ((Rogers, & Preece, 2007, p.241)
  - Making design decisions concrete by building them into the prototype
- Considering universal accessibility
  - Physical disability
  - Internalization/Cultural difference
  - Language barriers
  - Computer/Network Illiteracy

## **5. Evaluating the design**

- Usability criteria applied to DL design
  - Jakob Nielsen’s five usability attributes (Nielsen, 1993)
    - Learnability (easy to use)
    - Efficiency (efficient to use)
    - Memorability (easy to remember)
    - Errors (a low error rate)
    - Satisfaction (pleasant to use)
  - Kling and Elliott’s usability for digital libraries (Kling & Elliott, 1994)
    - Interface usability (4 attributes from Nielsen (1993))
      - Learnability
      - Efficiency
      - Memorability
      - Errors
    - Organizational usability
      - Accessibility
      - Compatibility

- Integrability into work practices
- Social-organizational expertise
- User acceptance of digital libraries (Thong, Hong, & Tam, 2002)
  - Interface characteristics
    - Terminology clarity
    - Screen design
    - Navigation
  - Organizational context
    - Relevance of the information systems to users' information needs
    - System accessibility
    - System visibility
  - Individual differences
    - Computer's self-efficacy
    - Computer experience
    - Domain knowledge
- Usability Evaluation by Analysts: Intended for formative evaluation
  - Heuristic Evaluation (Blandford, et al., 2004)
    - Quick, cheap, easy, and the most popular evaluation method
    - Working through every page or screen of a system
    - 3-5 analysts are recommended to examine the system (Nielsen, 1994)
    - Revising prototypes based on problems identified and prioritized during the evaluation

(For more detailed information about how to conduct a heuristic evaluation, please go to useit.com at <http://www.useit.com/papers/heuristic/>.)
  - Cognitive Walk-through (Wharton, et al., 1994)
    - User-centered perspective in design A team of analysts walk through tasks according to the following questions:
      - a. Who will be the users?
      - b. What tasks are to be analyzed?
      - c. What is the correct action sequence for each task?
      - d. How is the interface defined?
    - Each analyst evaluates the interface, considering the following questions:

- a. Will the user try to achieve the right goal? Does the interface raise the confusion in the goal?
      - b. Will the user notice that the correct action is available?
      - c. Will the user associate the action with their goal?
      - d. If the correct action is performed, with the user see that progress is being made towards the goal?
    - The notes from each analyst are compared and analyzed.
    - Revising prototypes based on problems identified and prioritized during the evaluation
  - Claims Analysis (CA)
    - Claims are “statements about the positive and negative effects of a design on the user within a particular context of use (a ‘scenario’)” (Blandford, et al., 2004, p. 31)
    - Less structured than Cognitive Walk-through, but more structured than Heuristic Evaluation
    - Creating scenarios first.
    - Analysts walk through the major features of the design while generating positive and negative claims about the design.
    - Analyzing the claims and identifying the methods to improve the claims.
- Usability Evaluation through Usability Testing: intended formative or summative evaluation
  - Subset of user studies of DL evaluation  
(For more detailed information about user studies, go to module 9-c: DL Evaluation, User studies)
  - Usability Testing (Nielsen, 1993)
    - Test goals, plans and budget
    - Getting test users (novice vs. experts)
    - Selecting test experimenters (facilitators)
    - Stages of a Test: Preparation, Introduction, Running a Test, Debriefing
    - Think Aloud Protocols (i.e., construct interaction, retrospective testing)
    - Lab Setting
      -  Figure 20. Floor plan for a hypothetical, but typical, usability laboratory (Nielsen, 1993, p201)
  - Videotaping a user test

- Screen capturing
- Use of the results
  - Interpreting and analyzing collected data
  - Making recommendations based on data analysis
  - Prioritizing the problems to change
  - Revising prototypes (interfaces)

## **11. Concept Map**

### **12. Exercises / Learning activities**

#### a. In-class Exercise I: Developing User Personas

This is a group activity. Students can be grouped by 3 or 4. Select a digital library that the group wants to use and evaluate for the exercise. Identify who are the primary users of a DL (and secondary users, if appropriate). Develop two personas per type of users (a novice user and an advanced user).

The Persona can be designed variously depending on what kinds of digital libraries are evaluated and how the tasks of the evaluation are designed. Here is an outline of what each person should include. (The list of items was originally developed from Cooper (1999). It was modified by Head (2003).) If appropriate, students can add or

delete items from the following list, when they develop their own personas for this exercise.

- A name
- Age
- A Photo
- Personal information, including family and home life
- Work environment
- Computer proficiency and comfort level with using the Web
- Pet peeves and technical frustrations
- Attitudes
- Motivation or “trigger” for using a high-tech product
- Information-seeking habits and favorite resources
- Personal and professional goals
- Candid quotes

After the group activity, each group will have presentations of which digital library they are targeting to develop the persona and who are the users in persona. The processes and challenges of developing a persona will be discussed in the class.

#### b. In-class Exercise II: Developing user tasks

This is a group activity. Form a group with the same students from the persona exercise. Use the same digital library that the group used for developing the user personas. Since the group did an exercise to create the user personas, it is expected that the group has abstract ideas about what users do in the digital library. In this exercise, the group has a chance to articulate the expected user activities and create user tasks pertinent to the digital library.

Two tasks should be designed. After creating the tasks, analyze the tasks based on the following guideline. Write the purpose of the study, the instruction of what to do in the context of a digital library, and example tasks.

To illustrate the finished product, here are the tasks used for a study of the Open Video repository:

Imagine that you are an emergency response officer in California and that you are developing an online tutorial on how to respond to an earthquake. You would like to illustrate the tutorial with several videos showing the damage that can be caused by an earthquake.

Imagine that you are a geography professor and are developing a presentation for your introductory class on the differing roles of rivers. You'd like to show clips from recent videos (since 1990) of several different rivers.

Imagine that you are a video enthusiast, having studied video production techniques since you were in your teens. You are interested in creating a montage of a selection of the really early films from the Open Video collection that are most popular with users of the site.

Imagine that you are a history professor, teaching a course on the history of technology in the U.S. You want to find some videos that illustrate America's growing obsession with cars/automobiles between 1930 and 1950.

After creating the tasks, groups will be paired up and each group will perform the tasks from the other group. After this experience with writing tasks and completing assigned tasks, the class should discuss the processes and challenges in developing, performing and analyzing DL search tasks.

c. Homework Assignment: Heuristic Evaluation

The instructor will introduce a digital library to the class. The selected digital library should be in the process of being built, e.g., it is available only in prototype, or has only recently been released. Students will be formed into groups of 2-3 people and each group will carry out the heuristic evaluation of the digital library.

Each group should conduct an evaluation of the selected digital library, identifying the ways in which its design violates one or more of the usability heuristics proposed by Jakob Nielsen:

- Visibility of system status
- Match between system and the real world
- User control and freedom
- Consistency and standards
- Error prevention
- Recognition rather than recall
- Flexibility and efficiency of use
- Aesthetic and minimalist design

- Help users recognize, diagnose, and recover from errors
- Help and documentation

(For more detailed information about how to conduct a heuristic evaluation, please go to useit.com at <http://www.useit.com/papers/heuristic/>.)

Each violation of a heuristic that is identified should be briefly described, along with notes about the ways in which the heuristic is violated.

After the evaluation, each group will write the evaluation results on blackboard in the classroom to share the results with the rest of the classmates. Compare the results and discuss the similar/different findings among groups. Prioritize the recommendations in order to improve the DL, and make suggestions for how the design's usability could be improved.
